BURNS BASE / PROJECT HANDOFF

How we got here. What happens next.

Updated October 17, 2026 · Sandbox development · No production release

THE WORK COMPLETED SO FAR

01 PROTECT THE ORIGINAL

Existing Steven OS files preserved

Stable v122 index kept unchanged. No personal records moved, erased or invented.

Verified file hash

02 BUILD AN ISOLATED SANDBOX

A safe place to prove sharing

Created fictional identities, private/shared test tables and household membership rules.

Isolated Supabase project

03 VERIFY THE ORIGINAL API

Prove permissions with real requests

27 UPDATE checks and 38 full-suite checks matched independent before/after snapshots. Approved cleanup preserved baselines.

Live API evidence

04 PROVE DEVICE SHARING

One change visible in another session

v132: Mac account A created a task; phone account B saw and completed it; A saw completion. Unrelated C stayed isolated.

Earlier live acceptance

05 AGREE THE PLANNER RULES

Tasks for adults; Activities for children

v133 demonstrated own Activities, sibling visibility, eligible Tasks, completion once and separate Shared contributions.

Design walkthrough + UI checks

06 INSTALL THE NEW DATABASE

Server-enforced roles and completion

Six new secured tables, transactional functions, assignments and attribution installed. Managed-Auth compatibility fixed; old records unchanged.

59 local checks + hosted SQL-role checks

YOU ARE HERE / WEBSITE INTEGRATION

Database installed. Website integration implemented.

v134 uses test-account sign-in and the new database functions.
Verify the browser flow → run actual Mac + phone acceptance.
The old role-switching demo is separate; it is not proof of live sign-in.

WHAT IS PROVEN — AND WHAT IS NOT

VERIFIED	Old API permissions + earlier Mac/phone sharing.
VERIFIED	New planner SQL rules; local concurrency and hosted role checks.
STILL TO VERIFY	Actual JWT/PostgREST + new preview across devices.
PLAN LIMIT	Leaked-password protection requires Pro. User chose Free for now.

THE NEXT PERSON SHOULD START HERE

1 Read docs/handoff/README.md and the newest development-log entry.

2 Open the connected planner preview; use saved fictional account passwords.

3 Verify A/B/C rules and a change from Mac → phone → Mac.

4 Record evidence honestly; never substitute simulated tests for real sign-ins.

5 Before real household use: security plan, onboarding, release review.

KEEP SAFE: stable index · existing private records · old policies · saved credentials

Draft review branch only. No merge, production promotion or unapproved cleanup.

Where the system is now

Updated October 25, 2026 · Preview only · Production unchanged

1 FOUNDATION

Original OS protected; private records, tabs, charts and backups kept separate.

2 SHARED PLANNER

Real accounts, household roles, tasks, activities, calendar and goals sync through Supabase.

3 FINANCE

Amanda's rules are installed as parent-only review and paycheck planning workflow.

4 BANKING NOW

Plaid Sandbox wiring is in place; final provider credential acceptance is the current checkpoint.

CURRENT BANKING DIAGNOSIS

Finance and Supabase returned successfully. The first error was browser CSP blocking the app's own API. That is fixed in 7373c68. The next error, PLAID_UNAVAILABLE, is now a Plaid Sandbox credential/request rejection. The actual PLAID_SECRET was replaced in Vercel Preview; no secret was shared here.

NEXT CHECKPOINT

1. Open the stable preview in a new tab.
2. Sign in as Dad or Mom → Finance Center → Connect bank · Sandbox.
3. If Plaid opens, complete the Sandbox institution flow and test Sync bank transactions.
4. If it rejects again, record only the provider error code; never share secrets or tokens.
